

## Note if you were able to recreate your wireframe.

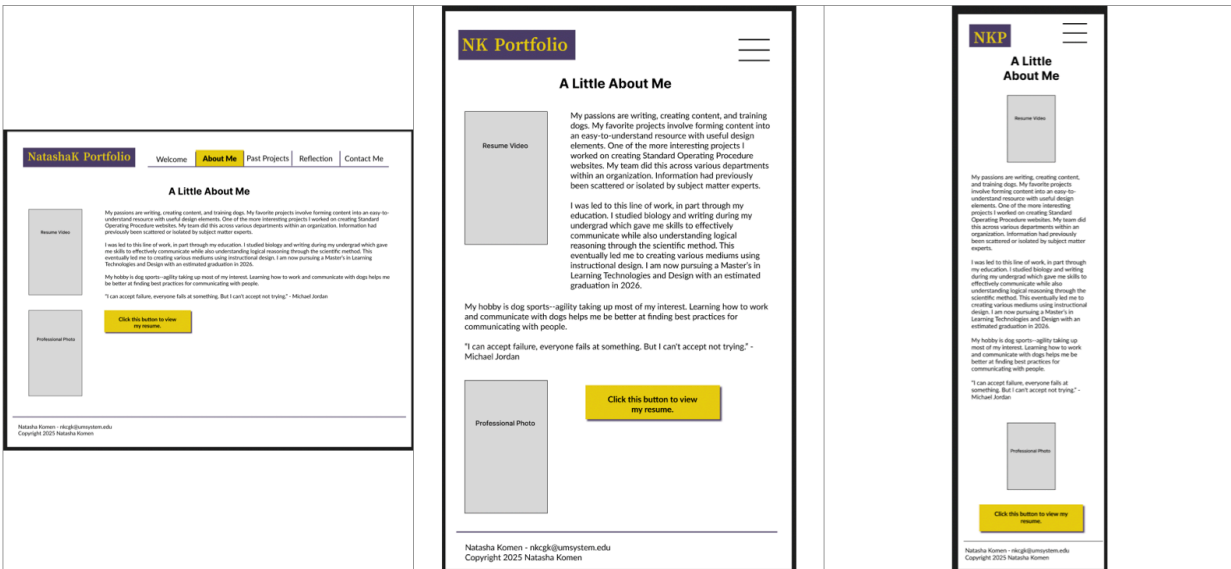

I think I did a pretty good job of recreating the desktop wireframe. It took a little work with grid sizes and layout to get what I wanted, but I'm pleased with how it turned out.

## Link to your about.html file on GitHub

## Screenshot of your wireframe

### Natasha Komen Portfolio - About Page

Hex Codes used: Purple (4C3F67), Gold (E7CC12), Black (000000)

Fonts: Lato and Lisu Bosa (logo)

Background colors are the gold used to highlight where on the website the user is and the button. The logo (NatashaK Portfolio) will be inserted as an icon.

Content inventory included in wireframes (at this point closer to a high fidelity design). The gray boxes symbolize the picture and video, I made notes in the design which is which.

I'm not sure if the resume will be included as a link or embedded into the website, so I assumed if it was a link I would like to use a button, but my design would obviously change if it was embedded in.

## Reflect on what were you successful with and what do you still need to work on?

My navigation with the logo needs work as well as adding media query in to make adjustments for screen size changes. I may also try to make changes to the resume button. I currently have a placeholder for the resume video, but depending on what we learn when we get to that portion, I may end up changing the design slightly.
